

GAPPY.AI · NATIONAL AI HACKATHON · POWERED BY LEMMA SDK

Ship to **Get Hired.**

Build. Get hired. Win ₹1 Lakh.

India's first hackathon powered by **Lemma SDK** — open-source infrastructure for coding agents to build agentic apps that run real work. Build a working agentic app, win from a ₹1 Lakh prize pool, and earn a direct hiring fast-track to AI-native companies. Open to all. Solo or teams up to 3. Free to enter.

Not just for developers — anyone can build. With Lemma SDK you can build entirely through prompting, so no deep coding background is required. What matters most is clear thinking: a sharply defined problem, real product sense, and the judgment to ship something people would actually use. Developers, PMs, operators, and students are all welcome.

At a Glance

Build window	June 24–30, 2026
Registration	Rolling — June 8–29
Prize pool	₹1,00,000 (cash prizes up to ₹1 Lakh)
Team size	Solo or teams up to 3
Entry	Free
Who can build	Developers, PMs, operators & students
Access	Open to all
Career	Hiring fast-track to partner companies
Roles	AI Product Engineer & AI Product Manager
Proof	Project certificates

Prize Pool

Rewards for the winning builds. The total prize pool is ₹1,00,000, split across first, second, and third place.

Placement	Prize
Total prize pool	₹1,00,000
First place	₹50,000
Second place	₹30,000
Third place	₹20,000

YesMadam · Binocs · Foxo · Zapdata · Corally

What You'll Build — The Challenge

Build a working agentic app with Lemma — open-source infrastructure for coding agents.

- 1. Build with Lemma SDK.** Use Lemma SDK as the infrastructure layer for your product. Lemma provides components like datastores, document stores, agents, workflows, functions, and integrations. Bring your own IDE, AI coding tool, API key, builder platform, and hosting or deployment setup.
- 2. Any real-world problem.** Pick a specific user, pain point, and workflow. Keep it useful and demoable.
- 3. Or pick a problem statement.** Choose a company challenge, a suggested use case, or your own problem.
- 4. Ship something functional.** Polish is optional. The core loop should work end-to-end.

Curated Problem Statements

Build from our suggested problem statements or bring your own idea. The goal is simple: solve a real problem. **Best fit:** Lemma works best for products that help someone manage a real workflow — not just a static website, a public app that doesn't require login, or a one-off chatbot.

AI Customer Support Desk for a Startup **SUPPORT**

Small startups receive customer issues across email, forms, and Slack. Build an AI support desk that can triage issues, search product docs, draft replies, track ticket status, and escalate important cases for review.

AI Bug Triage & Release Operator **ENGINEERING**

Startup development teams receive bugs, feature requests, and customer complaints across GitHub, Slack, email, and support channels. Build an AI operator that turns messy feedback into organized

issues, suggests priority, creates reproduction steps, links related bugs, tracks fixes, and prepares release notes.

AI PR Review & Release Readiness Assistant RELEASE

Small engineering teams ship fast but often miss broken flows, missing docs, untested edge cases, migration risks, and release notes. Build an AI assistant that reviews PR context, checks a release checklist, flags risks, prepares test plans, and creates release notes.

AI Meeting to Execution Operator EXECUTION

Meetings often end with decisions, tasks, and promises that are never properly tracked. Build an AI operator that turns meeting notes or transcripts into action items, owners, deadlines, follow-ups, and a live execution board.

AI Sales / Founder Follow-up CRM SALES

Founders, freelancers, and early sales teams often forget who to follow up with, what was promised, and which leads are warm. Build an AI CRM that tracks conversations, summarizes lead history, suggests next actions, drafts follow-ups, and keeps a priority queue.

AI Job Application Command Centre CAREER

Students and recent graduates apply to many jobs and internships across portals, referrals, emails, and LinkedIn. Build an AI command centre that tracks applications, parses job descriptions, suggests resume changes, drafts recruiter messages, and prepares interview notes.

AI Learning Companion LEARNING

Students struggle to turn notes, PDFs, lectures, and doubts into a clear learning plan. Build an AI learning companion that organizes study material, identifies weak topics, creates revision plans, generates practice questions, tests, and tracks learning progress.

Personal Life Command Centre LIFE OPS

People have commitments scattered across email, calendar, notes, documents, and memory. Build a personal command centre that tracks open loops, deadlines, recurring tasks, important documents, reminders, and follow-ups across everyday life.

AI Content Creator Backoffice CONTENT

Creators and young builders collect ideas across notes, screenshots, bookmarks, tweets, and conversations but rarely turn them into consistent output. Build an AI backoffice that captures ideas, clusters them into themes, drafts posts or scripts, manages a content queue, and prepares work for review.

AI Second Brain KNOWLEDGE

Most note-taking systems store information but do not help people act on it. Build an AI second brain that connects notes, files, links, and ideas; extracts useful insights; surfaces forgotten context; and helps turn knowledge into tasks, drafts, or decisions.

What is Lemma?

Open-source SDK for AI-native software

Most software records what happened. **Lemma is infrastructure for software that actually does the work** — combining structured data, AI agents, automated workflows, and custom interfaces in one environment. The SDK is open-source and locally runnable. It gives you the building blocks to ship agentic applications, multi-step workflows, and AI-powered products — without stitching together five different APIs.

What you can build with it

- AI agents with context
- Multi-step automations
- Searchable knowledge stores
- Custom team interfaces
- Event-driven workflows
- Structured data + AI actions
- End-to-end AI products

SDK launches publicly: June 24, 2026 — the same day the hackathon begins, so everyone starts fresh.

Timeline — How It Runs

From registration to results in less than a month.

Date	Milestone	Detail
June 8 - June 29	Rolling Registrations	Sign up by June 24. Get notified the moment the SDK drops and the build begins.
June 24	SDK launch + hackathon begins	Lemma SDK goes live publicly. Build window: June 24–30.
June 30	Submissions close	Submit your project, a short writeup, and a working demo.
~July 8	Results announced	Top 10 shortlisted. Winners announced. Hiring introductions made.

Judging Criteria

Judges weight real-world utility above everything else.

Weight	Criterion	What we look for
35%	Problem clarity & real-world fit	Is this a genuine problem? Is the target user specific?
25%	Product judgment	Does the solution fit the problem? Any wasted complexity?
25%	Execution quality	Does it actually work? Is the core loop functional?
15%	SDK utilisation	Did you use Lemma SDK meaningfully, not just superficially?

How the Hiring Fast-Track Works

Your submission goes to work for you — matched to open roles at AI-native companies. The candidates from this pipeline are strongest for two roles, available at both full-time and internship level: AI Product Engineer and AI Product Manager.

1. **Submissions evaluated.** Our panel reviews all submissions for problem clarity, product thinking, and execution quality.
2. **Candidates assessed.** Top builders are evaluated not just on what they built, but how they scoped and defended their decisions.
3. **Matchmaking.** We match shortlisted candidates to open roles at partner companies based on skills, product thinking, and role fit.
4. **Your profile is sent.** Your resume, project summary, and a written rationale for the match go directly to the hiring team — no cold applications.
5. **The interview.** Partner companies review your profile and may invite you directly for a first-round interview, with no CV screening, no recruiter filters.

No placement fees. No commissions. We introduce you — what happens next is between you and the company.

Project Track — Evolve Your Build Into a Real Lemma Project

Top 10 teams get the chance to keep building — with the Lemma team behind them.

1. **Top 10 shortlisted.** The top 10 teams or individual builders from the hackathon are invited to continue developing their project.
2. **Build under Lemma team's guidance.** Two more weeks to refine and develop your submission into a full-fledged product — with direct guidance from the Lemma team on architecture, SDK usage, and product decisions.
3. **Project certificate.** All participants who complete the project track receive a verified certificate of contribution — a real credential, not participation filler.
4. **Selected projects featured on Lemma.** The strongest projects are published on the Lemma website as community templates — discoverable by everyone building on the SDK.

2 additional weeks · By selection only

Common Questions

Do I need to know Lemma SDK before June 24?

No. The SDK launches publicly on June 24 — everyone starts fresh. Docs, starter templates, and community support are available from day one.

Do I need to bring my own IDE or coding agent?

Yes. Participants must bring their own development setup. Lemma provides the open-source SDK, starter examples, and documentation, but not an IDE, coding agent, model API key, or hosting environment. You can use any setup you prefer: Codex, Claude Code, OpenCode, Cursor, Windsurf, VS Code, Replit, Emergent, or another builder platform. Lemma SDK is the infrastructure layer you build with, especially for components like datastores, document stores, agents, workflows, functions, and integrations.

What counts as a functional product?

The core loop must work end-to-end and be demonstrable in a screen recording. Polished UI isn't required — it just needs to do the thing it claims to do.

What do I submit on June 30?

A form with: the problem you solved, your solution approach, a screen recording of the product in action, and team details. No decks required.

Can I participate solo?

Yes. Solo and teams of up to 3 are both eligible. All prizes and tracks apply equally.

Is the hiring track automatic for top performers?

If you're in the top 10, your profile goes to the relevant partner companies with a written rationale — no separate application needed.

Who's Behind This

Gappy AI

An AI startup building at the intersection of AI and real-world workflows. We've spent the last few years figuring out how AI can move beyond chatbots and actually help teams operate — that led us to Lemma, open-source infrastructure for AI-native software.

The team

IIT Kharagpur alumni on their second startup, having worked in and built products at some of India's leading companies. We built Lemma because we lived the gap ourselves — and got tired of patching it with spreadsheets.

Why this hackathon

The hiring track isn't a formality. We're invested in putting the right builders in front of the right companies — it's the kind of break we wished existed when we were starting out.

Ready to Build?

Registrations are open now. The SDK launches June 24 and the build window runs June 24–30.
